

PIZZA SALES ANALYSIS USING MYSQL

Prepared By

Name: Kunal Sandeep Jadhav

Abstract

The Pizza Sales Analysis project focuses on analyzing pizza sales data using MySQL and SQL queries. The objective of this project is to extract meaningful business insights from raw sales data by performing data analysis using SQL. The project includes revenue analysis, customer ordering patterns, top-selling pizzas, and peak ordering hours. This analysis demonstrates the practical application of SQL in business intelligence and decision-making.

Introduction

My name is Kunal Sandeep Jadhav, and this project is based on Pizza Sales Analysis using MySQL. In this project, I used SQL queries to solve business-related questions regarding pizza sales data. The analysis includes identifying order patterns, calculating revenue, finding top-selling pizzas, and determining peak ordering hours. This project demonstrates how MySQL can be used to analyze data and generate meaningful business insights.

Project Objectives

- Analyze pizza sales data using SQL.
 - Calculate total revenue generated from pizza sales.
 - Identify top-selling pizzas and categories.
 - Determine peak ordering hours.
 - Understand customer ordering patterns.
 - Generate business insights for better decision-making.
-

Software and Tools Used

- MySQL Workbench
 - MySQL Server
 - SQL (Structured Query Language)
 - Microsoft Word
 - Microsoft PowerPoint
-

Database Overview

The project uses four relational tables:

Orders

Stores information regarding order ID, order date, and order time.

Orders_Details

Contains details of pizzas ordered, including pizza ID, order ID, and quantity.

Pizzas

Stores pizza information such as pizza ID, size, and price.

Pizza_Types

Contains pizza names, categories, and ingredients.

The tables are connected using primary keys and foreign keys, allowing data from multiple tables to be combined using JOIN operations.

SQL Analysis Performed

The following analyses were performed using SQL queries:

1. Total number of orders placed.
2. Total revenue generated.
3. Highest-priced pizza.
4. Most common pizza size ordered.
5. Top five most ordered pizzas.
6. Category-wise distribution of pizzas sold.
7. Revenue generated by each pizza category.
8. Distribution of orders by hour of the day.

Results and Insights

- Customer orders are concentrated during specific hours of the day.
- Certain pizza categories contribute more revenue than others.
- A few pizza types account for the majority of sales.
- SQL queries helped transform raw sales data into useful business insights.

Conclusion

The Pizza Sales Analysis project successfully demonstrates the use of MySQL and SQL for data analysis. By applying SQL concepts such as JOIN, GROUP BY, ORDER BY, aggregate functions, and subqueries, meaningful insights were generated from the pizza sales dataset. This project improved my understanding of database management and practical data analysis techniques and highlighted the importance of SQL in business analytics and decision-making.
